## Summary

## Feedback

- ▶ Bunch passing through a resonant structure excites a wakefield which is sampled by the following bunches — a coupling mechanism;
- ▶ In practice the wakefields have much longer damping times than illustrated here;
- ▶ Longitudinal bunch oscillation  $\rightarrow$  phase modulation of the wakefield  $\rightarrow$  slope of the wake voltage sampled by the following bunches determines the coupling.
- ▶ For certain combinations of wakefield amplitudes and frequencies the overall system becomes unstable.

## Feedback

- ▶ Bunch passing through a resonant structure excites a wakefield which is sampled by the following bunches — a coupling mechanism;
- ▶ In practice the wakefields have much longer damping times than illustrated here;
- ▶ Longitudinal bunch oscillation  $\rightarrow$  phase modulation of the wakefield  $\rightarrow$  slope of the wake voltage sampled by the following bunches determines the coupling.
- ▶ For certain combinations of wakefield amplitudes and frequencies the overall system becomes unstable.

## Feedback

# Coupled-bunch Instabilities: Eigenmodes and Eigenvalues

- ▶ A system of  $N$  bunches (coupled harmonic oscillators) has  $N$  eigenmodes;
- ▶ From symmetry considerations we find that the eigenmodes correspond to Fourier vectors;
- ▶ Mode number  $m$  describes the number of oscillation periods over one turn;
- ▶ Wakefields affect the modal eigenvalues in both real (growth rate) and imaginary (oscillation frequency) parts;
- ▶ Motion of bunch  $k$  oscillating in mode  $m$  is given by:  $A_m e^{i2\pi km/N} e^{\Lambda_m t}$ 
  - ▶  $A_m$  — modal amplitude;
  - ▶  $\Lambda_m$  — complex modal eigenvalue.

# Coupled-bunch Instabilities: Eigenmodes and Eigenvalues

- ▶ A system of  $N$  bunches (coupled harmonic oscillators) has  $N$  eigenmodes;
- ▶ From symmetry considerations we find that the eigenmodes correspond to Fourier vectors;
- ▶ Mode number  $m$  describes the number of oscillation periods over one turn;
- ▶ Wakefields affect the modal eigenvalues in both real (growth rate) and imaginary (oscillation frequency) parts;
- ▶ Motion of bunch  $k$  oscillating in mode  $m$  is given by:  $A_m e^{i2\pi km/N} e^{\Lambda_m t}$ 
  - ▶  $A_m$  — modal amplitude;
  - ▶  $\Lambda_m$  — complex modal eigenvalue.

# Coupled-bunch Instabilities: Eigenmodes and Eigenvalues

- ▶ A system of  $N$  bunches (coupled harmonic oscillators) has  $N$  eigenmodes;
- ▶ From symmetry considerations we find that the eigenmodes correspond to Fourier vectors;
- ▶ Mode number  $m$  describes the number of oscillation periods over one turn;
- ▶ Wakefields affect the modal eigenvalues in both real (growth rate) and imaginary (oscillation frequency) parts;
- ▶ Motion of bunch  $k$  oscillating in mode  $m$  is given by:  $A_m e^{i2\pi km/N} e^{\Lambda_m t}$ 
  - ▶  $A_m$  — modal amplitude;
  - ▶  $\Lambda_m$  — complex modal eigenvalue.

# Coupled-bunch Instabilities: Eigenmodes and Eigenvalues

- ▶ A system of  $N$  bunches (coupled harmonic oscillators) has  $N$  eigenmodes;
- ▶ From symmetry considerations we find that the eigenmodes correspond to Fourier vectors;
- ▶ Mode number  $m$  describes the number of oscillation periods over one turn;
- ▶ Wakefields affect the modal eigenvalues in both real (growth rate) and imaginary (oscillation frequency) parts;
- ▶ Motion of bunch  $k$  oscillating in mode  $m$  is given by:  $A_m e^{i2\pi km/N} e^{\Lambda_m t}$ 
  - ▶  $A_m$  — modal amplitude;
  - ▶  $\Lambda_m$  — complex modal eigenvalue.

# Coupled-bunch Instabilities: Eigenmodes and Eigenvalues

- ▶ A system of  $N$  bunches (coupled harmonic oscillators) has  $N$  eigenmodes;
- ▶ From symmetry considerations we find that the eigenmodes correspond to Fourier vectors;
- ▶ Mode number  $m$  describes the number of oscillation periods over one turn;
- ▶ Wakefields affect the modal eigenvalues in both real (growth rate) and imaginary (oscillation frequency) parts;
- ▶ Motion of bunch  $k$  oscillating in mode  $m$  is given by:  $A_m e^{i2\pi km/N} e^{\Lambda_m t}$ 
  - ▶  $A_m$  — modal amplitude;
  - ▶  $\Lambda_m$  — complex modal eigenvalue.

# Modal Oscillation Example

- ▶ Harmonic number of 8;
- ▶ Top plot — mode 1;
- ▶ Bottom — mode 7;
- ▶ All bunches oscillate at the same amplitude and frequency, but different phases;
- ▶ Cannot distinguish modes  $m$  and  $N - m$  (or  $-m$ ) from a single turn snapshot.

Summary

# Coupled-bunch Instabilities: Eigenvalues and Impedances

- ▶ Beam interacts with wakefields (impedances in frequency domain) at synchrotron or betatron sidebands of revolution harmonics;
- ▶ Impedance functions are aliased, since they are sampled by the beam;
- ▶ Longitudinal:  $\Lambda_m = (-\lambda_{\text{rad}}^{\parallel} + i\omega_s) + \frac{\pi \alpha e f_{\text{rf}}^2 I_0}{E_0 h \omega_s} Z^{\parallel \text{eff}}(m\omega_0 + \omega_s)$ ;
- ▶ Effective impedance:  $Z^{\parallel \text{eff}}(\omega) = \sum_{p=-\infty}^{\infty} \frac{p\omega_{\text{rf}} + \omega}{\omega_{\text{rf}}} Z^{\parallel}(p\omega_{\text{rf}} + \omega)$
- ▶ Transverse:  $\Lambda_m = (-\lambda_{\text{rad}}^{\perp} + i\omega_{\beta}) - \frac{c e f_{\text{rev}} I_0}{2\omega_{\beta} E_0} Z^{\perp \text{eff}}(m\omega_0 + \omega_{\beta})$
- ▶ Effective impedance:  $Z^{\perp \text{eff}}(\omega) = \sum_{p=-\infty}^{\infty} Z^{\perp}(p\omega_{\text{rf}} + \omega)$

# Coupled-bunch Instabilities: Eigenvalues and Impedances

### Summary

# Bunch-by-bunch Feedback

## Definition

In **bunch-by-bunch feedback approach** the actuator signal for a given bunch depends only on the past motion of that bunch.

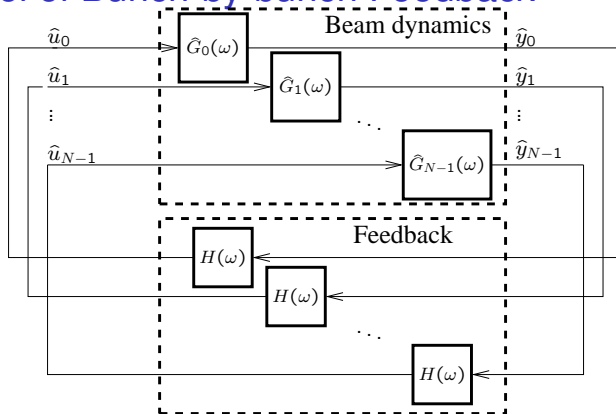

- ▶ Bunches are processed sequentially;
- ▶ Correction kicks are applied one or more turns later;
- ▶ Diagonal feedback — computationally efficient;
- ▶ Extremely popular in storage rings — why?

# MIMO Model of Bunch-by-bunch Feedback

- ▶  $N$  bunch positions and feedback kicks;
- ▶ Diagonal feedback matrix  $H(\omega)\mathbf{I}$ ;
- ▶ Invariant under coordinate transformations.

# MIMO Model of Bunch-by-bunch Feedback

- ▶ Coordinate transformation to eigenmode basis;
- ▶  $N$  feedback loops — one per mode;
- ▶ **Identical feedback applied to each mode.**

- ▶ Actuator (kicker).

## Feedback

- ▶ To sense beam position we typically use capacitive button beam position monitors (BPMs);
- ▶ Buttons couple capacitively to the beam, differentiating bunch current shape;
- ▶ BPM signals are wideband differentiated pulses with 100–400 ps duration;
- ▶ Differentiation means sensor gain increases with frequency.

# Beam Position Sensor

- ▶ To sense beam position we typically use capacitive button beam position monitors (BPMs);
- ▶ Buttons couple capacitively to the beam, differentiating bunch current shape;
- ▶ BPM signals are wideband differentiated pulses with 100–400 ps duration;

- ▶ For X and Y we are dealing with small differences of large signals;
- ▶ If we can reject the common-mode at 20–30 dB level, that is also the gain of low-noise amplifier we can use to improve sensitivity.

# Analog Front-end Design

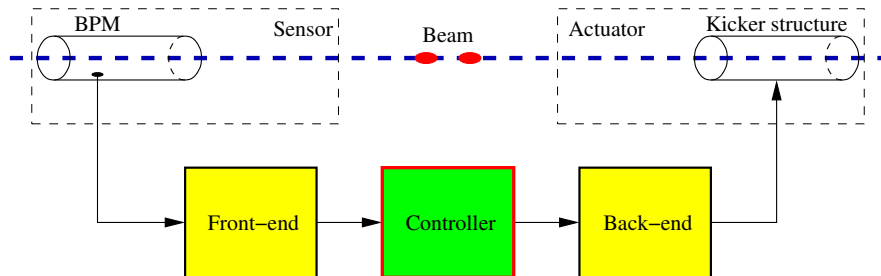

- ▶ Front-end requirements:
  - ▶ Low amplitude and phase noise;
  - ▶ Wideband to ensure high isolation between neighboring bunches.
- ▶ Input bandpass filter is an analog FIR filter that replicates BPM pulse with spacing, matched to detection LO period;
- ▶ Detection frequency choice:
  - ▶ High frequencies for sensitivity;
  - ▶ Must stay below the propagation cut-off frequency of the vacuum chamber.
- ▶ Local oscillator adjusted for amplitude (transverse) or phase (longitudinal) detection.

# Bunch-by-bunch Feedback

- ▶ Sensor (pickup);
- ▶ Analog front-end;
- ▶ Controller;
- ▶ Analog back-end;
- ▶ Actuator (kicker).

- ▶ FPGA implements algorithmically simple, but computationally intensive processing.

# Inside the FPGA

- ▶ Multiple filter chains to match FPGA processing rate to the bunch crossing rate;
- ▶ Uneven stepping scheme — use groups of  $n$  and  $n + 1$  bunches to make sure signal from a given bunch ends up in the same filter chain on consecutive turns;
- ▶ Bunch-by-bunch excitation and feedback enables;
- ▶ Back-end compensation.

Bunch Cleaning

Summary

# Feedback Filter

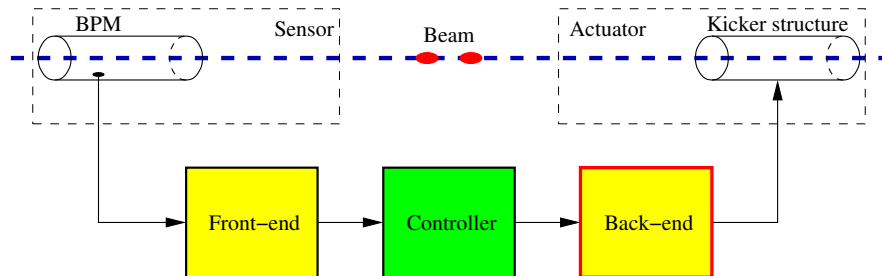

- ▶ Requirements:
  - ▶ Adjustable phase shift at the tune frequency;
  - ▶ DC rejection to get rid of constant orbit offsets;
  - ▶ Low group delay.
- ▶ Filter design approach — sample one period of a sine wave;
  - ▶ Group delay is  $\frac{1}{2}$  of oscillation period;
  - ▶ Nicely parameterized, often close to optimal.
- ▶ More sophisticated design methods are required when large perturbations are present or with variable beam dynamics, etc.

# Bunch-by-bunch Feedback

- ▶ Sensor (pickup);
- ▶ Analog front-end;
- ▶ Controller;
- ▶ Analog back-end;
- ▶ Actuator (kicker).

# Bunch-by-bunch Feedback

- ▶ Sensor (pickup);
- ▶ Analog front-end;
- ▶ Controller;
- ▶ Analog back-end;
- ▶ Actuator (kicker).

# Analog Back-end

- ▶ Longitudinal kickers are usually built as highly damped (low Q, wideband) cavities at 1–1.5 GHz;
- ▶ Baseband kick must be upconverted to the right frequency to drive these;
- ▶ Phase linearity is critical to maintain the same feedback for different modes;
- ▶ Constant group-delay filters are used to create single-sideband modulation to efficiently drive kicker cavity.

## Bunch Cleaning

## Summary

- ▶ 50  $\Omega$  striplines driven differentially;
- ▶ Counter-propagating beam and kick signals;
- ▶ For 2 ns bunch spacing maximum stripline length is 1 ns:
  - ▶ Fill time of 1 ns;
  - ▶ Beam propagation time of 1 ns;
  - ▶ Longer striplines will couple the kick to neighboring bunches.
- ▶ Shorter striplines — better isolation, have smaller kick.

### Summary

## Demonstration Summary

- ▶ Saturday, September 21:
  - ▶ Started from unpacking hardware around 11:15;
  - ▶ Connected A – C hybrid output to the front-end, iGp12 outputs to amplifiers A and C;
  - ▶ Set up transverse feedback in X and Y by 14:00;
  - ▶ After lunch set up fast tune tracking to characterize tune variation;
  - ▶ Investigated observed offsets between spectrum analyzer and feedback notch tune measurement methods.
- ▶ Sunday, September 22:
  - ▶ Reconfigured for an A/B comparison with the SPring-8 system;
  - ▶ Performed vertical and horizontal calibration;
  - ▶ Reconfigured the feedback input chain, recalibrated;
  - ▶ Spent the rest of the day demonstrating bunch cleaning.
- ▶ Monday, September 23:
  - ▶ Configured the feedback to increase camshaft bunch current;
  - ▶ Investigated transverse stability as a function of insertion device gaps;
  - ▶ Left ring running overnight with 7 mA camshaft bunch.

# How Does One Characterize an Unstable System?

- ▶ Standard methods of characterization:
  - ▶ Frequency domain — transfer function;
  - ▶ Time domain — step/pulse response.
- ▶ These methods fail for unstable beam;
- ▶ In 1990s our group at SLAC developed so-called transient diagnostics:
  - ▶ Upon some trigger, turn off feedback and start recording beam motion;
  - ▶ Unstable motion grows from ever-present noise-floor level excitation;
  - ▶ After an adjustable open-loop time period, turn feedback on;
- ▶ Resulting data set captures open-loop growth of the fastest unstable modes and closed-loop damping;
- ▶ Used to characterize driving terms (impedances) and feedback performance, optimize tuning.

- ▶ Open loop time of 22 ms shows typical ion behavior — motion saturates at low amplitudes.

## Feedback

- ▶ High single bunch current leads to coupling of dipole and head-tail modes — transverse mode coupling instability (TMCI);
- ▶ PLS-II vertical TMCI threshold is 4.3 mA;
- ▶ Feedback cannot affect the head-tail modes, but damping of the dipole mode is enough;
- ▶ A single-bunch grow/damp — feedback turned off for camshaft bunch only;
- ▶ Fast growth, 0.5 ms open-loop time;
- ▶ High feedback gain means capture range is limited;
- ▶ Feedback on at 0.6 ms only slows down the growth.

- ▶ High single bunch current leads to coupling of dipole and head-tail modes — transverse mode coupling instability (TMCI);
- ▶ PLS-II vertical TMCI threshold is 4.3 mA;
- ▶ Feedback cannot affect the head-tail modes, but damping of the dipole mode is enough;
- ▶ A single-bunch grow/damp — feedback turned off for camshaft bunch only;
- ▶ Fast growth, 0.5 ms open-loop time;
- ▶ High feedback gain means capture range is limited;
- ▶ Feedback on at 0.6 ms only slows down the growth.

# Growth Rate vs. Camshaft Current

- ▶ Growth rates vs. camshaft bunch current;
- ▶ Current is estimated from the scope peak-to-peak amplitude;
- ▶ Steep rise in growth rates, reaching  $6 \text{ ms}^{-1}$  at 7 mA — 180 turns;
- ▶ Reached 7.6 mA with the demonstration setup;
- ▶ With a separate X and Y processors (each driving four amplifiers) one can expect to reach even higher camshaft currents.

Summary

# Steady State Spectra Under Feedback Control

- ▶ In transverse planes there are very few steady-state disturbances;
- ▶ Instabilities are damped to the noise floor;
- ▶ Spectrum is determined by the detection noise and the feedback loop response;
- ▶ Open loop transfer function  $L(\omega)$  peaks at beam resonance;
- ▶ Transfer gain from the detection noise to the feedback input is  $\frac{1}{1+L(\omega)}$ ;
- ▶ Maximum attenuation at beam resonance — a notch.

## Feedback

- ## Summary

- ▶ Overnight capture of tune monitor at 1 Hz;
- ▶ Averaging time constant of around 30 s to mask injections;
- ▶ Observed an offset of  $\approx 0.005$  between the notch and the swept spectrum analyzer measurement;
- ▶ This offset is due to the amplitude-dependent tune shift, since notch measurement happens at much lower oscillation amplitudes.

## Parasitic Tune Measurement

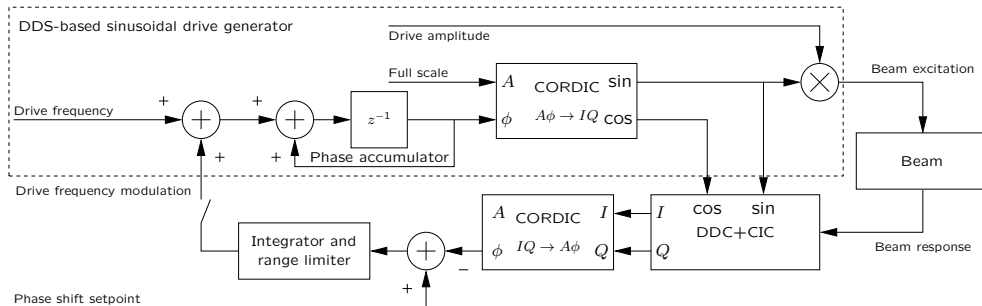

- ▶ Overnight capture of tune monitor at 1 Hz;
- ▶ Averaging time constant of around 30 s to mask injections;
- ▶ Observed an offset of  $\approx 0.005$  between the notch and the swept spectrum analyzer measurement;
- ▶ This offset is due to the amplitude-dependent tune shift, since notch measurement happens at much lower oscillation amplitudes.

- ▶ This offset is due to the amplitude-dependent tune shift, since notch measurement happens at much lower oscillation amplitudes.

# Single Bunch Phase Tracking

- ▶ A single bunch is excited with a sinusoidal excitation;
- ▶ Response is detected relative to the excitation to determine the phase shift;
- ▶ In closed loop, phase tracker adjusts the excitation frequency to maintain the desired phase shift value;
- ▶ Adjustable integration time, tracking range, loop gain.

## Tune Measurements

## Summary

- ▶ Bunch cleaning is done by iGp12 as follows:
  - ▶ Apply normal negative feedback to the bunches we want to keep;
  - ▶ Turn off the feedback for the bunches to be removed;
  - ▶ Apply sine or square wave excitation with frequency sweeping to the bunches we are cleaning.
- ▶ With two power amplifiers we barely had enough kick to clean;
- ▶ Removed 3 bunches: 296, 299, 300;
- ▶ After cleaning optimization, with 9 bunches cleaned;
- ▶ Need optical diagnostics to characterize bunch purity.

# Summary

- ▶ Successfully demonstrated Dimtel bunch-by-bunch feedback in PLS-II;
- ▶ Used one unit to control both X and Y planes;
- ▶ Demonstrated control of resistive wall and ion coupled-bunch instabilities as well as control of TMCI (single-bunch instability);
- ▶ Demonstrated a number of advanced beam control and diagnostic techniques, such as bunch cleaning, parasitic tune measurement, fast tune tracking.
