# Outline

- 1 Introduction
  - Metrology Light Source Parameters
  - Coupled-bunch Instabilities
- 2 Qualitative Overview
  - Feedback Operation
  - Qualitative Summary
- 3 Beam Studies
  - Single Bunch Calibration
  - Longitudinal Grow/Damp Measurements
  - Vertical Grow/Damp Measurements

# Machine Parameters

- Small 500 MHz electron storage ring;
- Used by German national metrology institute;
- Very low energy injection, ramping;
- Too small for an ion clearing gap;
- Rich beam dynamics.

## Parameters

Injection energy	105 MeV
Operating energy	629 MeV
Circumference	48 m
Harmonic number	80
Beam current	200 mA
RF frequency	500 MHz
Tunes, X/Y	3.18/2.23
Natural emittance	110 nm rad
Damping time, $\parallel/\perp$	11/22 ms

# Outline

- 1 Introduction
  - Metrology Light Source Parameters
  - **Coupled-bunch Instabilities**
- 2 Qualitative Overview
  - Feedback Operation
  - Qualitative Summary
- 3 Beam Studies
  - Single Bunch Calibration
  - Longitudinal Grow/Damp Measurements
  - Vertical Grow/Damp Measurements

# Instabilities and Control

- Both transverse and longitudinal coupled-bunch instabilities are present in the MLS;
- Strong energy sensitivity;
- In the transverse plane the beam is very sensitive to the coupling;
- A full complement of bunch-by-bunch feedback systems is installed and commissioned.

# Instabilities and Control

- Both transverse and longitudinal coupled-bunch instabilities are present in the MLS;
- Strong energy sensitivity;
- In the transverse plane the beam is very sensitive to the coupling;

  - Single Bunch Calibration
  - Longitudinal Grow/Damp Measurements
  - Vertical Grow/Damp Measurements

# Operating Approach

- Inject and ramp without feedback;
- Coupling knob dialed to 100% to reduce losses;
- At full energy, turn on the feedback systems ( $Z \rightarrow X \rightarrow Y$ );
- Reduce the coupling knob to 10%–25%;
- Beam spot shrinks, lifetime drops;
- Sometimes coupling reduction still leaves the beam blown up;
- Transient excitations can often facilitate the transition.

# Operating Approach

# Qualitative Observations

- With all feedback systems operating the beam is stable long-term;
- Destabilizing transients (feedback tuning, grow/damps) can lead to the loss of control;
- Unstable motion in both X and Y;
- Impossible to recapture, see both centroid motion and blow-up;
- Need to raise the coupling, turn off the feedback systems to re-stabilize;
- Sensitivity to gain balancing between horizontal and vertical planes.
- Very strong sensitivity to fill patterns.

# Qualitative Observations

## Single Bunch Calibration

## Front-end Calibration: Transverse Plane

- Set up controlled orbit bumps in X and Y;
- Measure bunch signal displacement in ADC counts;
- At 2 mA per bunch ADC LSB corresponds to 26 and 10  $\mu\text{m}$  in X and Y respectively;

# Front-end Calibration: Transverse Plane

- Set up controlled orbit bumps in X and Y;

- At 2 mA per bunch ADC LSB corresponds to 26 and 10  $\mu\text{m}$  in X and Y respectively;

# Vertical Tune Measurement

- Single bunch at 0.23 mA excited with a swept-sine signal;
- Sweep span of 7 kHz around 1450 kHz;
- At the excitation amplitude of 0.05 FS tune is "pushed" by the swept excitation;
- Fit second-order beam response to the spectrum;
- Little tune shift at low amplitudes.

# Vertical Tune Measurement

- Single bunch at 0.23 mA excited with a swept-sine signal;

## Vertical Grow/Damp Measurements

## A Grow/Damp Measurement (Small)

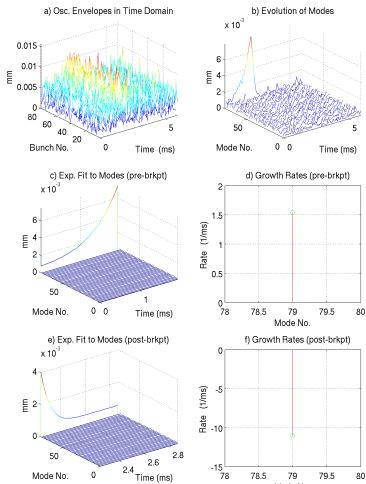

- Mode -1 growing and damping at low amplitude ( $9 \mu\text{m}$  peak);
- Fast feedback damping;
- Exponential fits look good;
- Positive tune shift of 0.01;
- Small tune shift increase in open loop, some reactive shift from the feedback.

## Vertical Grow/Damp Measurements

## A Grow/Damp Measurement (Small)

MLS:oct2711/195708: I<sub>0</sub>=107.142mA, D<sub>samp</sub>=1, ShifGain=1, ModP=80,  
At Fs: G1=29.9001, G2=0, Ph1=-105.9289, Ph2=0, Brkpt=14000, Callb=48.25.

- Mode -1 growing and damping at low amplitude ( $9 \mu\text{m}$  peak);
- Fast feedback damping;
- Exponential fits look good;
- Positive tune shift of 0.01;
- Small tune shift increase in open loop, some reactive shift from the feedback.

# A Grow/Damp Measurement (Small)

- Mode -1 growing and damping at low amplitude (9  $\mu\text{m}$  peak);

## Vertical Grow/Damp Measurements

## A Grow/Damp Measurement (Medium)

MLS:oct2711/195827: Io= 106.3132mA, Dsamps= 1, ShfGain= 1, Mode= 80,  
At Fs: G1= 30.1261, G2= 0, Ph1= -103.6825, Ph2= 0, Brkpt= 21000, Calib= 48.25.

- Mode -1 growing to  $21 \mu\text{m}$  peak;
- Same initial frequency as before, large downward shift;
- Large tune shift starts at around  $12 \mu\text{m}$  amplitude.

# A Grow/Damp Measurement (Medium)

- Mode -1 growing to  $21 \mu\text{m}$  peak;
- Same initial frequency as before, large downward shift;
- Large tune shift starts at around  $12 \mu\text{m}$  amplitude.

# A Grow/Damp Measurement (Medium)

- Mode -1 growing to  $21 \mu\text{m}$  peak;
- Same initial frequency as before, large downward shift;
- Large tune shift starts at around  $12 \mu\text{m}$  amplitude.

## Vertical Grow/Damp Measurements

## A Grow/Damp Measurement (Large)

a) Osc. Envelopes in Time Domain

b) Evolution of Modes

c) Exp. Fit to Modes (pre-brkpt)

d) Growth Rates (pre-brkpt)

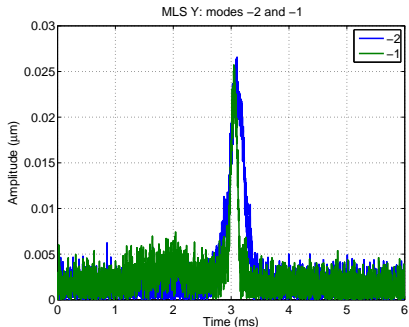

MLS:oct2711/200426: Io= 102.6373mA, Dsamp= 1, ShifGain= 1, N= 80,  
At Fs: G1= 29.341, G2= 0, Ph1= -110.7215, Ph2= 0, Brkpt= 12474, Calib= 48.25.

- A large spike in the transient;
- Low mode -1 amplitude in open-loop, large spikes in closed loop;
- Initial part of mode -1 transient looks normal;
- Mode -2 starts tune shifted above 1650 kHz - tune shift of 0.03.

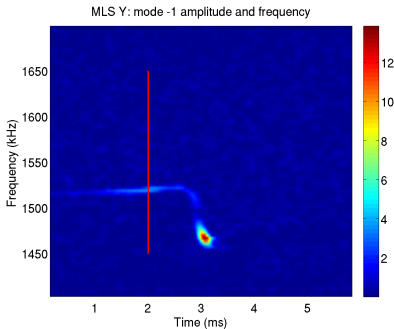

# A Grow/Damp Measurement (Large)

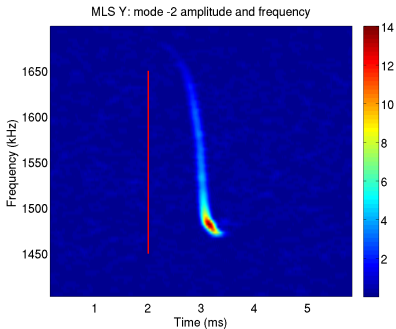

- A large spike in the transient;
- Low mode -1 amplitude in open-loop, large spikes in closed loop;
- Initial part of mode -1 transient looks normal;
- Mode -2 starts tune shifted above 1650 kHz - tune shift of 0.03.

# Two States: A Hypothesis

- It almost seems that feedback is mis-tuned when transverse motion cannot be suppressed;
- Reasonable ( $\pm 60$  degrees) feedback phase adjustments do not help;
- Are we picking up signals from both the beam and the ions?
- Phase shift between electron and ion oscillations would explain control difficulties;
- In transients, ion motion makes the difference between clean damping and loss of control/spikes in closed-loop.

# Ideas for Future Measurements

- Try DC clearing voltage at or near the feedback pickups;
- Use a second acquisition system to measure the signal between the bunches;
- Try transient measurements with large feedback phase shifts in the unstable/blown-up state.

# Ideas for Future Measurements

- Try DC clearing voltage at or near the feedback pickups;

- Try transient measurements with large feedback phase shifts in the unstable/blown-up state.

# Summary

- We have observed very rich transverse dynamics;
- Dramatically different behavior from machines at higher energy (or operating with ion clearing gap);
- Can we mine the data for more information? What else should we measure?
- What is the best way to test the "mixed signals" model?

# Summary
