

Bunch-by-bunch feedback and diagnostics in SSRF

Demonstration of iGp12 and FBE-500LT

D. Teytelman

Dimtel, Inc., San Jose, CA, USA

December 14, 2016

Outline

- 1 Setup
- 2 Spectra and Modal Analyses
 - Parasitic Measurements
 - Active Studies
- 3 Beam Transfer Functions
- 4 Tune Tracking
- 5 Injection Transients

Setup

- Baseband processor (iGp12) and front end (FBE-500LT) set up on a table;
- Used two buttons (BPM8), unused by the existing feedback processor;
- Minimal perturbation of the existing system.
- Took advantage of the maintenance day to check amplifier responses, establish drive levels.

Day by Day Summary

- Monday (2016-12-12):
 - ▶ Unpacked the hardware;
 - ▶ Found unused BPM signals and RF clock source;
 - ▶ First parasitic measurement at 13:58.
- Tuesday (2016-12-13):
 - ▶ Late start to rest before the night shift;
 - ▶ Temporarily connected two power amplifiers, adjusted drive levels and measured pulse responses.
- Wednesday (2016-12-14):
 - ▶ Started at 5:45, done by 9:00;
 - ▶ Multibunch beam at 50 mA by 7:47;
 - ▶ Full current by 8:08;
 - ▶ Too little time to optimize the setup.

Day by Day Summary

Amplifier Responses

- Conceptual sketch of the measurement;
- Measured response to a 2 ns pulse from iGp12 DAC;
- Used two amplifiers, 1 and 3;
- Significant differences between the two;
- Easier to see if waveforms are normalized;
- Both amplifiers are 1 dB into saturation, 16 and 31 W at peak.

Amplifier Responses

- Conceptual sketch of the measurement;
- Measured response to a 2 ns pulse from iGp12 DAC;

Noise Floor Problem

- Comparison with a few other machines:
 - ▶ BESSY II horizontal;
 - ▶ BESSY II vertical;
 - ▶ ALS vertical;
 - ▶ SSRF.
- Wideband spectra show a wide range of spurs (ALS lines are revolution harmonics);
- All 22 machines with commissioned Dimtel systems use direct signal from the master oscillator as RF reference.

Noise Floor Problem

- Comparison with a few other machines:

- 2 Spectra and Modal Analyses**
 - Parasitic Measurements
 - Active Studies
- 3 Beam Transfer Functions
- 4 Tune Tracking
- 5 Injection Transients

First Data Set

- Surprisingly, found a large line at the horizontal frequency;
 - ▶ Later on discovered that some connectors on Spring-8 system were not fully tightened;
 - ▶ Possibly a cable was disturbed during our setup, causing loss of horizontal control;
 - ▶ Fixed at 16:00.
- Steady oscillation amplitudes;
- Single mode 719 (-1) — resistive wall.

First Data Set

SSRF:dec1216/135832: Io= 250mA, Dsamp= 1, ShifGain= 0, Nbnun= 720,
At Fs: G1= 0.38621, G2= 0.00086812, Ph1= -80.6856, Ph2= -40.7921, Brkpt= 1, Calib= 1.

- Surprisingly, found a large line at the horizontal frequency;
 - ▶ Later on discovered that some connectors on Spring-8 system were not fully tightened;
 - ▶ Possibly a cable was disturbed during our setup, causing loss of horizontal control;
 - ▶ Fixed at 16:00.
- Steady oscillation amplitudes;
- Single mode 719 (-1) — resistive wall.

Horizontal Spectra

- Stable and unstable spectra;
- Second one taken after poor cable connections were re-torqued.

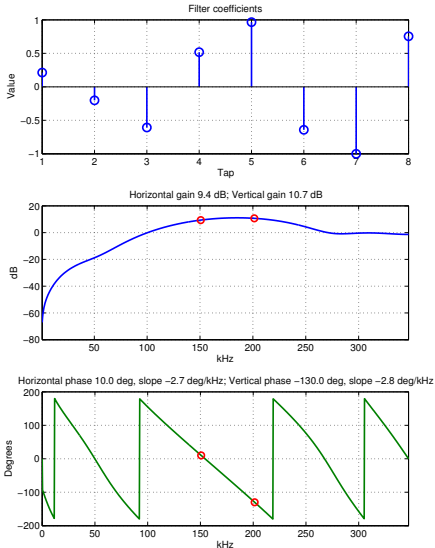

Outline

- 3 Beam Transfer Functions
- 4 Tune Tracking
- 5 Injection Transients

Feedback Filter

- 8-tap FIR filter;
- Designed by a Matlab optimizer from a specification of tunes, gains, and phases for X and Y;
- Phases optimized for resistive feedback;
- Guaranteed DC rejection (orbit offsets).

Closed-loop Steady-state Spectra

- Same spectrum, zoomed around f_x and f_y ;
- iGp12+FBE-500LT at 250 mA;
- Existing system at 237 mA;
- Very similar performance.
 - ▶ In case of iGp12 performance is dominated by RF reference noise.

Closed-loop Steady-state Spectra

- Same spectrum, zoomed around f_x and f_y ;

Horizontal Grow/Damp

a) Osc. Envelopes in Time Domain

b) Evolution of Modes

c) Oscillation freqs (pre-brkpt)

d) Growth Rates (pre-brkpt)

e) Oscillation freqs (post-brkpt)

f) Growth Rates (post-brkpt)

- Feedback loop is open for 45 ms;
- Captured data shows mode -1 growing and damping;
- Growth time 21.4 ms, damping time 0.7 ms;
- Very little frequency shift, feedback tuned for resistive damping;
- Modulation of the modal amplitude is due to a nearby spur.

SSRF:dec1416/081522: Io= 247.7mA, Dsamp= 2, ShiGain= 4, N bun= 720,
At Fs: G1= 11.0485, G2= 0, Ph1= -92.3343, Ph2= 0, Brkpt= 15200, Calib= 1.

- 5 Injection Transients

Single Bunch Acquisition

- Single bunch acquisition engine captures 98304 samples of a single selected bunch (141 ms);
- Swept sinusoidal excitation with 40 ms sweep period;
- Multi-bunch fill, feedback disabled for this bunch;
- State of the drive generator is captured simultaneously, allowing beam transfer function estimation;
- Analytical fit.

Vertical Beam Transfer Function

- Same approach, excitation centered around nu_y ;
- Analytical fit;
- Caveat — if the tune changes during the measurement, resulting BTF is widened.

Vertical Beam Transfer Function

- Same approach, excitation centered around nu_y ;

Tune Tracker Block Diagram

Tune Tracker: Horizontal

Horizontal fast tune tracker

- Fast tracking, 500 turns integration;
- Several shots in quick succession;
- Drifts on the scale of seconds, smaller fast transients.

Tune Tracker: Horizontal

Injection Transient

- Trigger derived from the feedback unit output;
- RMS clearly identifies the injected bunch;
- Change in DC value corresponds to current change;
- Another bunch, perturbed by injection kicker;
- Fit damping time of 7.7 ms.

Injection Transient

- Trigger derived from the feedback unit output;

Summary

- **Successfully operated Dimtel bunch-by-bunch systems in SSRF;**
- At 250 mA observed mild horizontal instabilities due to the resistive wall, no vertical instabilities;
- Smaller ion-driven motion could be obscured by the noisy reference;
- Measured beam transfer functions, tested fast and slow tune tracking;
- Bunch cleaning was attempted, but had insufficient voltage to sufficiently excite the beam;
- I'd like to thank everyone who helped to make this a successful test in spite of challenging circumstances!
