# Single Bunch Phase Tracking

- ▶ A single bunch is excited with a sinusoidal excitation;
- ▶ Response is detected relative to the excitation to determine the phase shift;
- ▶ In closed loop, phase tracker adjusts the excitation frequency to maintain the desired phase shift value;
- ▶ Adjustable integration time, tracking range, loop gain.

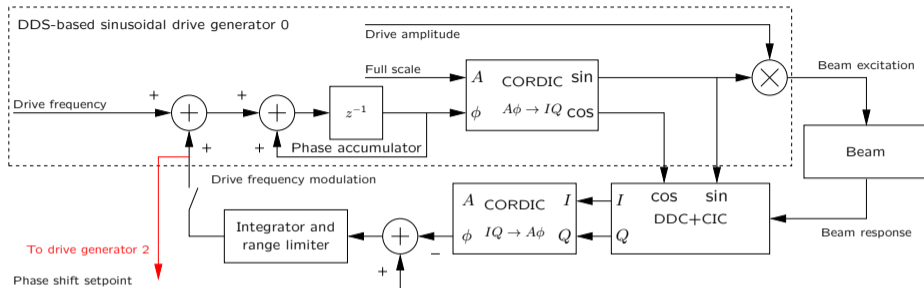

Technology

Understanding Tracking  
Data

Looking at Systematics

Response Fitting

# Single Bunch Phase Tracking

- ▶ Dual drive generators, each exciting one bunch;
- ▶ Drive generator 0 is under closed-loop tracking;
- ▶ Drive generator 2 can be configured to follow the tracking signal;
- ▶ Allows for adjustable offset in drive 2 while following common-mode tune jitter.

Technology

Understanding Tracking  
Data

Looking at Systematics

Response Fitting

# Tracking Behavior

- ▶ Closed-loop tracking on bunch 187;
- ▶ Pure sinusoidal excitation of bunch 1;
- ▶ Significant amplitude variation;
- ▶ Drive 2 following enabled;
- ▶ Amplitude is stabilized for both bunches;
- ▶ Can measure beam transfer function magnitude for bunch 1 by scanning drive frequency.

Response Fitting

# Extracting the Response

- ▶ Average magnitude plotted vs. drive frequency;
- ▶ Offset due to DC average in tune tracker correction;
- ▶ Drive 0 is set to 225.744 kHz, closed loop 225.69 kHz;
- ▶ Add average tracker offset to drive 2 frequency in tracking on state;
- ▶ Drive 2 tracking off correction:
  - ▶ Estimate how much the tune moved away from the average (tracking frequency offset without DC);
  - ▶ Subtract that value from drive 2 frequency.

Response Fitting

# One More Correction

- ▶ Average tracker offset changes from -50.3 to -56.7 Hz between the two scans;
- ▶ Slow tune drifts?
- ▶ Corrected the drive 2 tracking off scan by 6.4 Hz;
- ▶ Almost on top of each other, some loss near the peak;
- ▶ Fast tune jitter in SPEAR3 is relatively small;
- ▶ Dual tracking is still critical to remove sensitivity to slow common-mode drifts.

# Summary

- ▶ **Successfully tested "follow the tracker" mode;**
- ▶ Different information vs. dual tracker tests;
- ▶ Changes of the beam transfer function with amplitude and bunch current mean that dual tracker mode is sensitive to mismatches in gain;
- ▶ Avoiding systematics:
  - ▶ Keep bunch current low;
  - ▶ Measure at different drive levels to project to zero drive point;
  - ▶ Dual trackers miss complex BTF evolution, likely source of systematic errors.
- ▶ Discussion...
